Fog Shield XP™

“WHAT MAKES IT WORK SO WELL”

"Fogging occurs when water forms tiny droplets on the surface of a lens resulting in obscured vision. Our Fog Shield XP product consists of a unique combination of hydrophobic and hydrophilic components that cause the tiny water droplets to sheet out invisibly on the coated surface, providing for clear, unobstructed vision. As the moisture continues to build on the lens it is simply released back into the environment leaving your lenses clear. Fog Shield's proprietary formulation provides maximum anti-fog protection"

Do not forget that Fog Shield XP contains the Sight Savers™ lens cleaning fluid as well providing anti-fog protection.

Hydrophilic- causes moisture to be absorbed while simultaneously releasing it back into the environment.

Hydrophobic- reacts to moisture, forming a thin invisible film of water, referred to as "sheeting".
